

Resolved Support Ticket

NC-1842 / Enterprise upload failure at a consistent size boundary

RESOLVED

Customer confirmed recovery - 2026-06-18 16:24 UTC

Account	BluePeak Logistics	Priority	P2 - workflow blocked
Owner	Maya Chen, Senior Support Engineer	Product area	File ingestion
Opened	2026-06-18 13:07 UTC	Resolved	2026-06-18 16:24 UTC

Problem

Problem: BluePeak Logistics could upload files smaller than 100 MB, but files over 100 MB failed with HTTP 413. The failure occurred in the browser and through the API.

Customer impact

Twenty-three users could not upload daily shipment archives. Existing files and smaller uploads continued to work, so the account was degraded but not fully unavailable.

Decision reasoning

Reasoning: The identical cutoff across browser and API requests indicated a configured boundary rather than random network instability. The expert chose to reproduce around the boundary and trace the request through every layer before changing production settings.

Completed investigation and resolution

1. Captured the tenant ID, request IDs, timestamps, browser error, API response, and one sanitized filename.
2. Reproduced successfully with a 99 MB file and reproduced the failure with a 101 MB file in the customer's region.
3. Compared browser, API gateway, and upload-service logs. The API gateway rejected the request before it reached the upload service.
4. Verified that the tenant entitlement allowed 200 MB uploads but the regional gateway still used the legacy 100 MB limit.
5. Opened change CHG-771, received platform approval, updated the regional gateway limit to 200 MB, and retained the rollback value.
6. Re-tested 99 MB, 101 MB, 150 MB, exactly 200 MB, and 201 MB. Files through 200 MB succeeded; 201 MB returned the approved limit message.
7. Sent the customer the confirmed cause, completed fix, safe retry instructions, and monitoring period.

Tools and methods

Software: Northstar Cloud Support Console; Northstar Cloud API Gateway; Postman; Datadog; Jira.

Methods: Boundary testing; request tracing; configuration comparison; reversible production change; customer confirmation.

Outcome

Outcome: A 150 MB production upload completed successfully, the 200 MB boundary behaved as documented, monitoring showed no elevated gateway errors, and BluePeak Logistics confirmed that its shipment workflow was restored.

Reusable judgment

When a failure repeats at the same measurable boundary, compare the working and failing paths on both sides of that boundary. Confirm which system layer rejects the request before changing configuration.
